

EEE304 – Digital Design with HDL (II)

Lectures 3-4

Dr. Ming Xu

Dept of Electrical & Electronic Engineering

XJTLU

In This Session

- Instructions: Language of the Computer

Instruction Set

- The repertoire of instructions of a computer
- Different computers have different instruction sets
 - But with many aspects in common
- Early computers had very simple instruction sets
 - Simplified implementation
- Many modern computers also have simple instruction sets

The MIPS Instruction Set

- Used as the example throughout the book
- Stanford MIPS commercialized by MIPS Technologies (www.mips.com)
- Large share of embedded core market
 - Applications in consumer electronics, network/storage equipment, cameras, printers, ...
- Typical of many modern ISAs
 - See MIPS Reference Data tear-out card, and Appendixes B and E

Arithmetic Operations

- Add and subtract, three operands
 - Two sources and one destination

add a, b, c # a gets b + c
- All arithmetic operations have this form
- *Design Principle 1: Simplicity favours regularity*
 - Regularity makes implementation simpler
 - Hardware for a variable number of operands is more complicated than hardware for a fixed number.

Arithmetic Example

- C code:

```
f = (g + h) - (i + j);
```

- Compiled MIPS code:

```
add t0, g, h    # temp t0 = g + h
add t1, i, j    # temp t1 = i + j
sub f, t0, t1   # f = t0 - t1
```

Register Operands

- Arithmetic instructions use register operands
- MIPS has a 32×32 -bit register file
 - Use for frequently accessed data
 - Numbered 0 to 31
 - 32-bit data called a “word”
- Assembler names
 - \$t0, \$t1, ..., \$t9 for temporary values
 - \$s0, \$s1, ..., \$s7 for saved variables
- *Design Principle 2: Smaller is faster*
 - c.f. main memory: millions of locations

The Constant Zero

- MIPS register 0 (\$zero) is the constant 0
 - Cannot be overwritten
- Useful for common operations
 - E.g., move between registers
add \$t2, \$s1, \$zero

Register Operand Example

- C code:

`f = (g + h) - (i + j);`

– `f, ..., j` in `$s0, ..., $s4`

- Compiled MIPS code:

`add $t0, $s1, $s2`

`add $t1, $s3, $s4`

`sub $s0, $t0, $t1`

Representing Instructions

- Instructions are encoded in binary
 - Called machine code
- MIPS instructions
 - Encoded as 32-bit instruction words
 - Small number of formats encoding operation code (opcode), register numbers, ...
 - Regularity!
- Register numbers
 - \$t0 – \$t7 are reg's 8 – 15
 - \$t8 – \$t9 are reg's 24 – 25
 - \$s0 – \$s7 are reg's 16 – 23

MIPS R-format Instructions

- Instruction fields
 - op: operation code (opcode)
 - rs: first source register number
 - rt: second source register number
 - rd: destination register number
 - shamt: shift amount (00000 for now)
 - funct: function code (extends opcode)

R-format Example

op	rs	rt	rd	shamt	funct
6 bits	5 bits	5 bits	5 bits	5 bits	6 bits

add \$t0, \$s1, \$s2

special	\$s1	\$s2	\$t0	0	add
---------	------	------	------	---	-----

0	17	18	8	0	32
---	----	----	---	---	----

000000	10001	10010	01000	00000	100000
--------	-------	-------	-------	-------	--------

$$00000010001100100100000000100000_2 = 02324020_{16}$$

Logical Operations

- Instructions for bitwise manipulation

Operation	C	Java	MIPS
Shift left	<<	<<	sll
Shift right	>>	>>>	srl
Bitwise AND	&	&	and, andi
Bitwise OR			or, ori
Bitwise NOT	~	~	nor

- Useful for extracting and inserting groups of bits in a word

Shift Operations

op	rs	rt	rd	shamt	funct
6 bits	5 bits	5 bits	5 bits	5 bits	6 bits

- rs: 0, rt: source register, rd: destination register
- shamt: how many positions to shift
- Shift left logical
 - Shift left and fill with 0 bits
 - sll by i bits multiplies by 2^i
- Shift right logical
 - Shift right and fill with 0 bits
 - srl by i bits divides by 2^i (unsigned only)

AND Operations

- Useful to reset bits in a word
 - Select some bits, clear others to 0

and \$t0, \$t1, \$t2

\$t2	0000 0000 0000 0000 0000 1101 1100 0000
\$t1	0000 0000 0000 0000 0011 1100 0000 0000
\$t0	0000 0000 0000 0000 0000 1100 0000 0000

OR Operations

- Useful to set bits in a word
 - Set some bits to 1, leave others unchanged

or \$t0, \$t1, \$t2

\$t2	0000 0000 0000 0000 0000 1101 1100 0000
\$t1	0000 0000 0000 0000 0011 1100 0000 0000
\$t0	0000 0000 0000 0000 0011 1101 1100 0000

NOT Operations

- Useful to invert bits in a word
 - Change 0 to 1, and 1 to 0
- MIPS has NOR 3-operand instruction
 - $a \text{ NOR } b == \text{NOT} (a \text{ OR } b)$

`nor $t0, $t1, $zero` ← Register 0: always read as zero

\$t1 0000 0000 0000 0000 0011 1100 0000 0000

\$t0 1111 1111 1111 1111 1100 0011 1111 1111

Memory Operands

- Main memory used for composite data
 - Arrays, structures, dynamic data
- To apply arithmetic operations
 - Load values from memory into registers
 - Store result from register to memory
- Memory is byte addressed
 - Each address identifies an 8-bit byte
- Words are aligned in memory
 - Address must be a multiple of 4
- MIPS is Big Endian
 - Most-significant byte at least address of a word
 - *c.f.* Little Endian: least-significant byte at least address

Memory Operand Example 1

- C code:

```
g = h + A[8];
```

– g in \$s1, h in \$s2, base address of A in \$s3

- Compiled MIPS code:

– Index 8 requires offset of 32

- 4 bytes per word

```
lw    $t0, 32($s3)    # load word
add   $s1, $s2, $t0
```

offset

base register

Memory Operand Example 2

- C code:

`A[12] = h + A[8];`

– `h` in `$s2`, base address of `A` in `$s3`

- Compiled MIPS code:

– Index 8 requires offset of 32

```
lw    $t0, 32($s3)    # load word
```

```
add   $t0, $s2, $t0
```

```
sw    $t0, 48($s3)    # store word
```

MIPS I-format Instructions

- load/store instructions
 - rs: base address
 - rt: source register (store) or destination register (load)
 - offset address
 - memory address = base address + offset address
- Sign extension (offset address)
 - replicate the sign bit to the left, e.g. 8-bit to 16-bit
 - +2: 0000 0010 => 0000 0000 0000 0010
 - -2: 1111 1110 => 1111 1111 1111 1110

Registers vs. Memory

- Registers are faster to access than memory
- Operating on memory data requires loads and stores
 - More instructions to be executed
- Compiler must use registers for variables as much as possible
 - Only spill to memory for less frequently used variables
 - Register optimization is important!

Immediate Operands

- Constant data specified in an instruction
`addi $s3, $s3, 4`
- No subtract immediate instruction
 - Just use a negative constant
`addi $s2, $s1, -1`
- *Design Principle 3: Make the common case fast*
 - Small constants are common
 - Immediate operand avoids a load instruction

MIPS I-format Instructions

- Immediate arithmetic instructions
 - rs: source register
 - rt: destination register
 - Constant: -2^{15} to $+2^{15} - 1$
- *Design Principle 4: Good design demands good compromises*
 - Different formats complicate decoding, but allow 32-bit instructions uniformly
 - Keep formats as similar as possible
