Please contribute to these documents.

If you're looking for an effective way to familiarise yourself with the course material, you can't go past collaborating with fellow students. We have laboured to put these up, and so at the very least point out where you think we are wrong!

You'll get more out of the course, you'll do better in the exam, and other students will benefit from your input as well.

To get editing permissions, simply go to the chatroom and provide us with your Google Account address.e

Style.

Type answers in blue beneath each question.

If you're unsure of your answer, highlight your answer text then hit Ctrl+Alt+M to create a comment beside the text. Once you're satisfied with the answer, click the "Resolve" button on the comment.

If you want some extra explanation from someone else on their answer, highlight the other person's answer and repeat the procedure above.

Communicate.

Head over to <u>uqattic.net</u> and click "Chat Now!". You'll find a chatroom full of students just like you. Talk about a revision document (like this one) or swap prep tips. If you have your own IRC client, point it to irc.uqattic.net, port 6667, channel #attic.

Question 1. (20 marks)

Calculate performance metrics for various process schedulers.

All of the schedulers are pre-emptive – a process is pre-empted as soon as a higher priority process appears.

In the following tables, times are all in milliseconds.

Assume processes do not stall for I/O. Ignore scheduler delays. Processes that miss their deadline are not included in the calculation of individual and average completion time 20/11/2023, turnaround time, waiting time or throughput. The CPU time of aborted processes is included in CPU utilisation.

(a) Complete both of the following tables for a Shortest Job First (SJF) Scheduler. (10 marks)

| | Arrival Time | Execution Time | Deadline | Completion Time | Turnaround Time | Waiting Time |
|----|-----------------|----------------|----------|--------------------|--------------------|-----------------|
| P1 | 0 | 5 | 7 | 5 | 5 | 0 |
| P2 | 5 | 4 | 10 | 9 miss | 4 n/a | 0 n/a |
| P3 | 6 | 3 | 11 | 12 9 | 3 | 0 |
| P4 | 10 | 2 | 14 | 14 12 | 2 | 0 |
| P5 | 13 | 1 | 20 | 15 14 | 1 | 0 |
| P6 | 14 | 5 | 25 | 20 19 | 5 | 0 |
| P7 | 20 | 3 | 30 | 23 | 3 | 0 |

| Average Waiting Time | 0 |
|-------------------------|---------------------------|
| Average Turnaround Time | 3.28ms 3.17ms |
| Actual CPU Utilisation | 100% 91% |
| Average Throughput | 304 jobs/second 260 job/s |

Process Timeline Table (Mark where a process Starts (S), Runs (R), Pauses (P), Ends (E). You can add more columns if required.

| Р7 | | | | | | | | | | | | | | | | | | | | |

../Question 1 continued over the page

Since at 6 seconds when P3 arrives the job P2 now only has 3 seconds left to execute?

My answer had P2 miss. When P3 arrives it has a shorter initial execution time, but a longer remaining execution, so P2 is made to wait for P3. My understanding of a Shortest Job First scheduler was that only the initial execution time is compared? Otherwise it is a Shortest Remaining Job First scheduler?

Yeah that makes more sense I think I wasn't sure.

Question 1 (continued).

(b) Repeat part a) but now assume that two CPU cores (core 1 and core 2) can be used to run processes, concurrently. Complete the three following tables for a Shortest Job First (SJF) Scheduler. You must consider the core affinity (core 1, core 2 or X – any core). You can assume that a process with no affinity (X) can run on any core. (10 marks)

| Process Number | Arrival Time | Execution Time | | | Completion Time | Turnaround Time | Waiting Time |
|-------------------|-----------------|----------------|----|---|--------------------|--------------------|-----------------|
| P1 | 0 | 5 | 7 | 1 | 5 | 5 | 0 |
| P2 | 5 | 4 | 10 | 2 | 9 | 4 | 0 |
| P3 | 6 | 3 | 11 | X | 9 | 3 | 0 |

Question 2. (20 marks)

Suppose that a disk drive has 3000 cylinders, numbered 0 to 2999. The disk rotates at 250 rpm. The drive is currently serving a request at cylinder 303, and the previous request was at cylinder 101. The queue of pending requests, in FIFO order, is:

201; 310; 2200; 330; 1500; 300; 1200; 655;

For each of the indicated disk scheduling algorithms (a) to (d) below, calculate the following information:

- (i) Starting from the current head position, where a block has just been read, and assuming the previously read block was in cylinder 101, what is the order in which pending blocks are read?
- (ii) Assume that a disk seek takes $15ms + 20 \mu s$ per cylinder. Assume that the rotational latency is 50% of the rotation time, and also assume that there are 250 blocks per track. Based on the block read order, calculate the total time to read each block (latencies + read time).
- (iii) Then calculate the total time to read the 8 blocks, starting from the time the read at 303 was completed.

(a) FCFS (5 marks) (i)Block

Read Order: +1

| rioda Ori | 401. | | | | | | | |
|-------------|----------|----------|-----------|--------|--------|--------|--------|--------|
| 303 | 201 | 310 | 2200 | 330 | 1500 | 300 | 1200 | 655 |
| (ii)Block | Read Tim | ie | | | | | | |
| | 138 | 138.14 | 173.76 | 173.36 | 159.36 | 159.96 | 153.96 | 146.86 |
| (iii) Total | Time 124 | 13.4ms = | 1.24 seco | onds | | | | |

250 rpm = 1/250 minute per rotation * 60 sec p min * 1000 ms p sec = 240ms/rotation Rotational latency = 50% 240ms = 120ms Block read = 240 ms rot / 250 = 0.96 ms/block read time.

l.e. 303 to 201 = 102 cylinders. Block read time = 15ms + 0.02(102) + 120ms + 0.96ms = 138ms

(b) SCAN (5 marks) (i)Block

Read Order: +1

| (c) A virtual machine consists of three components: host, Virtual Machine Manager (VMM) or Hypervisor and a guest. Describe each component. (6 marks) |
|---|
| Host is the native operating system of the computer and is the actual computer upon which all other VMS are launched. The Hypervisor is a program which generates,manages and controls the VMs on a host. Guest is an OS in a VM which is running atop a host |
| |

../Question 5 continued over the page

Question 5 (continued)

(d) What is paravirtualization? (2 marks)

Paravirtualization is where the OS is modified to work in conjunction with a VMM to increase the efficiency. It allows VMS to have an interface similar to the underlying hardware

Question 6. (20 marks)

You have been asked to design an operating system for a weather satellite. The weather satellite takes periodic images of the earth, using a camera (high latency, high priority, no security), infrared sensor (high latency, low priority, requires security) and a radar (low latency, high priority, no security). All the image and sensor data is periodically transmitted to an earth ground station. If transmission is not possible, then all data must be stored on the satellite. The satellite is powered by solar panels but must also operate in reduced power mode when sunlight is not available. The satellite must

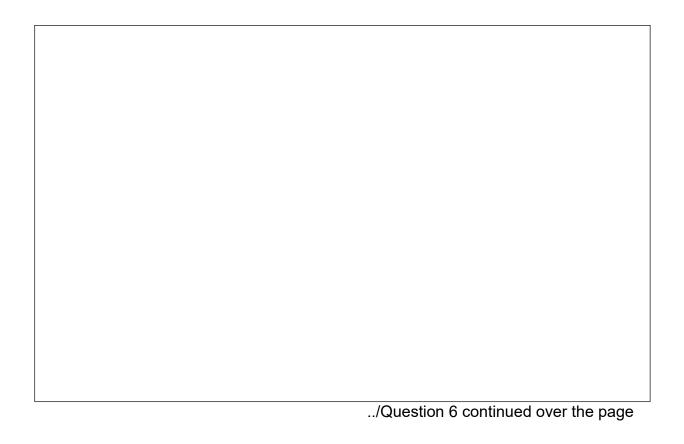

operate in harsh radiation and extreme temperature conditions. Harsh radiation environments can cause errors in various electronic devices such as hard drive storage. Extreme temperatures can affect the running of CPU cores. The operating system should use multiple CPU cores for parallelism.

For each of the indicated aspects of the operating system:

- (i) Describe your suggested design alternative,
- (ii) Give one other less favourable choice,
- (iii)Explain two advantages of the suggested alternative compared to the less favourable choice
- (a) What type of Parallelism should be used (Data vs Task) (5 marks)
- (i) Suggested solution (ii) Less favoured alternative
- (iii) Two advantages of suggested solution

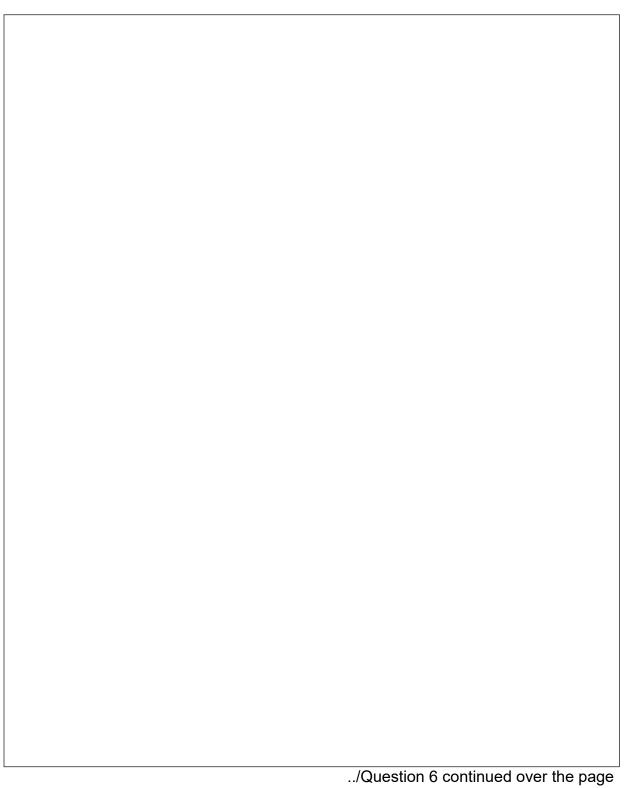

i)Data ii) Task

iii) Data is more favourable as it allows all the data from the different sensors to be distributed over the different processors. This means that the data from each sensor can be processed quicker as opposed to the task parallelism which would do it for each task

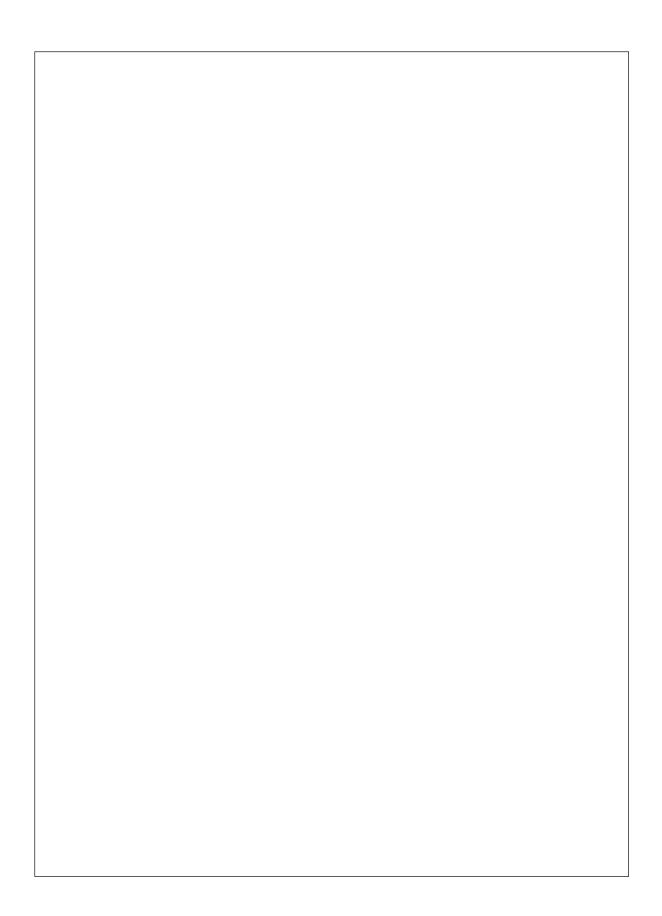

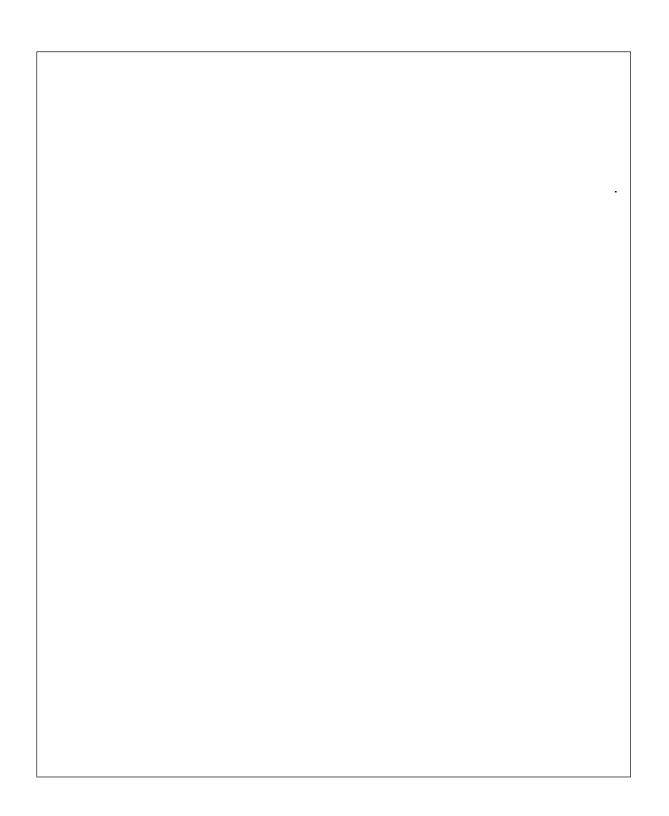

- (b) Reduce deadlock and starvation of resources (e.g. transmission link). (5 marks) (i) Suggested solution (ii) Less favoured alternative (iii) Two advantages of suggested solution

| i)resource preemption ii)process termination iii) Resource preemption is better in this case as it will release resources until a deadlock is removed which will prevent resource starvation? |

- **(c)** What security mechanism should be used to ensure that the data is only received by the intended recipient. (5 marks) (i) Suggested solution (ii) Less favoured alternative
- (iii) Two advantages of suggested solution
- i) Public key encryption of data ii) digital signature iii) Public key encryption of the data can be used to ensure that only the intended recipient receives the data. By encrypting it with the recipients public key only the recipient will be able to see the data by decrypting it with it's private key. A digital signature is only able to detect whether the data has been modified and therefore does not prevent an attacker from seeing the data.

./Question 6 continued over the page

| (d) RAID Disk level (0 to 6) (5 marks) (i) Suggested solution (ii) Less favoured alternative (iii) Two advantages of suggested solution i) RAID 6 ii) RAID 1. iii) RAID 6 has parity error bits which are great for error detection which might be caused by the extreme temperatures. RAID 1 does not have this error detection as it only mirrors the data. RAID 6 also stripes the data making it easier to access across multiple disks and it provides best parity protection in case of 2 drive crash. |
